### What are Isoquinoline derivatives?

1,2,3,4-Tetrahydroisoquinolines/Isoquinoline derivatives are very important class of synthetic and natural compounds, which display a broad range of medicinal activities such as antitumor, antibacterial, antiplasmodial, and  $\beta$ -adrenergic receptor antagonism. The various potentially useful derivatives are shown in below chart. At Eburon the synthetic knowledge is not limited to the products listed but can be expanded to new derivatives as per customer request.
